

KIDNEYWEEK 2015

San Diego, CA • Nov 3-8

Curing Kidney Disease: At the Crossroads of Biology, Infastructure, Patients and Government

Wednesday, November 4

Attend this early program to learn more about a multidisciplinary approach to “curing kidney disease.” The emphasis throughout the program is the development of a translational, multidisciplinary, and innovative approach to improve the lives of patients with kidney disease. This provides a great opportunity for interactions with different stakeholders (patients, health professionals, industry partners, and regulator authorities) involved in this area, and it pulls participants out of their individual comfort zones and into a true multidisciplinary partnership.

Attend this course and discuss the interconnected roles of drug and device discovery, clinical trial methodology, and infrastructure, as well as the patient voice and regulatory/reimbursement pathways in developing new and effective therapies for kidney disease.
